
Types Of cs Present In The Space Time Dimension

Even though perception of a wormhole is pretty difficult for a human being to understand. It can be explained and understood if the concept was projected. Imagine if space was a piece of paper of unimaginable length and width that can easily be folded on either side of the paper. On paper there are two points drawn 50 billion light years far away from each other. Fold the paper in such a way that two areas of location should overlapped each other. Pierce a hole between the two overlapped regions using a pencil. The hole that is present between two overlapped locations is called a wormhole and it is a gate between two locations. In theory if we tried to pass a payload through the wormhole it could cover so many distances at a few instances of time. As the payload is just a door or a gate far away from the location it has to arrive. In theory the payload has broken the speed of light with the help of a wormhole. If a payload is passed between these holes it could cover so much distance at a much less time and in theory could also break the "limit" of the speed of light.

After imagining the wormhole concept in space we have now known and understood the basic working concept of a wormhole. Wormholes do exist as it has been supported by not only by the means of observation or science fiction media but also by many religious books as well. For example in the Holy Quran it provides evidence that when angels travel in space they experience different time e than the time humans experience on earth. "The angels and the Spirit will ascend to Him during a Day the extent of which is fifty thousand years." The angels take only 1 day to travel from any location in space which is equivalent to 50000 human years and it is possible using the concept of wormholes. Even Science fiction related media also uses the concept and theory of wormholes. Like in "Interstellar " which is a movie about wormholes released in the year 2014 by the director of the movie Christopher Nolan. In the movie it is shown that people are travelling to different galaxies using a wormhole and the reason is that they are trying to find other terrestrial planets that can sustain life. Worm holes comes in various shapes and sizes and these come with many different scientist who theorize about the types of wormholes in the first place.

Many scientist have debated each other on the subject of wormholes and have come up with a universal agreement that around six primary types of wormholes present in the space time dimension. "Traversable worm hole" which have the ability to transport object one location of space in one point to the other location. Second is a non-traversable wormholes in which the door of the wormhole is not stable enough to let anyone out, it has a high probability of being collapsed. If a human or a payload would have to pass through it could easily destroy both of them. Third is a "one-way" wormholes that could only allow only the path of moving forward but no path of return. There are two types which are black holes and white holes. "Text to be added

here about black holes and white holes”. Fourth there is a “two way worm holes” which can not only provide going route but there is always a return route provided by the two way worm hole as well. Fifth one is called an “Intra-Universe wormholes” which can help the traveler or a travelling object to cover distances that are far apart from each other in space time but those distances would be within the single universe. “Inter-Universe wormholes” can help objects to travel.
